

ABSTRACT OF THE DISCLOSURE

In a radio receiver integrated vehicular meter unit, a receiver circuit of the radio receiver is arranged on the side of a meter circuit board opposite to the side on which a CPU and a communication IC included in a meter circuit are mounted. The distance between the receiver circuit board and the CPU or the communication IC increases by the thickness of the meter circuit board. As a result, a receiver circuit formed on the receiver circuit board is less affected by noise caused by the CPU or the communication IC.
